Zhou, L. and Declerck, S. A. J. 2020. Maternal effects in zooplankton consumers are not only mediated by direct but also by indirect effects of phosphorus limitation. – Oikos doi: 10.1111/oik.06898

Appendix 1

Figure 1. The molar C:P ratios of algae from different food treatments. No significant difference was found for molar C:P between HP and LP+P food, whereas both of which were significantly lower than that in LP food (one-way ANVOA, HP-LP: p<0.001, LP+P-LP: p<0.001). Symbols and error bars represent the mean ± 2 SE, respectively. Each mean value represents the average of five independent chemostat replicates, with two measurements for each chemostat replicate. Note that in the text SD means standard deviation.
