

Start, D. 2020. Phenotypic plasticity and community composition interactively shape trophic interactions. – Oikos
doi: 10.1111/oik.07194

Appendix 1

Table A1. Loadings for the first principal component ($R^2 = 65\%$). Note that high values are associated with cladoceran species (e.g. ‘Daphnia 1’), while low values are associated with copepods (e.g. ‘Cyclopidae 1’). PC scores are then roughly inversely proportional to the metric “proportion copepods” found elsewhere in the manuscript.

Species	Loading
Daphnia 1	0.98
Cyclopidae 1	-0.99
Scapholeberis	0.10
Simocephalus	0.99
Ceriodaphnia	0.18
Bosminidae	0.59
Daphnia 2	0.16
